ABSTRACT. *In the social environment of the new era, China's regional economic pattern has begun to change from the coastal areas supporting the economic growth of the whole country to the multi-level pattern of common development of the coastal and central and western regions, which shows that China's regional economy is developing in the direction of coordination. However, from the current situation of regional economic development, there are still too many differences between each other, and regional coordinated development will cause certain obstacles. Therefore, in the future development process, in order to promote the coordination of regional economy, we should reasonably build the relevant driving mechanism, and enhance the coordination of regional economic development under the support of perfect driving mechanism.*

KEYWORDS: *Regional Economy, driving mechanism, coordinated development*

1. Introduction

The coordinated development of regional economy means that each region can open to each other, carry out close economic exchanges, scientifically allocate resources, mobilize the rapid economic development of each region, and reduce the economic development gap between different regions. In the process of constructing the driving mechanism, we should clearly study the factors of regional comparative advantage and economic connection, reasonably construct the relevant driving mechanism, shorten the economic gap between various regions under the guidance of improving the mechanism, and promote the progress of economic synergy and stability of various regions in China[1].

2. The Importance of Coordinated Development of Regional Economy

In terms of the economic development of various regions in China, coordinated development means that different regions open to each other and reasonably divide labor in the process of close contact, so as to improve the economic stability within the region and reduce the gap between them, which can promote the sound

economic progress within a certain range. During this period, only the coordinated development of economy between different regions can better promote the stability and progress of China's overall economy

2.1 It can promote the good flow of high-quality resources

From the actual situation, regional economy is not an independent development, which region to sustainable, stable progress, must be open, only open development, in order to better carry out the flow of technology advantage resources, talent advantage resources, information advantage resources, capital advantage resources, make the regional economic level has been improved, in a variety of advantages Under the drive of resources, economic benefits and economic development effects will be enhanced.

2.2 It helps to promote regional cooperation and competition

In order to promote the coordinated development of regional economy, it is necessary to have good cooperation and competition with each other. While maintaining autonomy, it is necessary to enhance the stability of economic endogenous power, so as to contribute to the sustainable and healthy development of economy and play a good role in promoting economic development.

2.3 Enhance the stability of regional economic development

For the regional economic development, in the process of collaborative progress, it can ensure the stability of the economy, promote the good operation and improve the operation efficiency. In general, in the process of regional economic collaborative progress, collaborative theory is a very important basis, which can provide accurate basis for the research, strategy making and decision-making of economic collaborative development. With the support of synergy theory, we can define the order parameters of different regional economic development, create a driving mechanism with certain reliability advantages, and give full play to the advantages of relevant mechanisms, so as to promote the stable development and progress of regional economy.

3. An Analysis of the Driving Factors of the Coordinated Development of Regional Economy

In the process of building the relevant driving mechanism, we should deeply study and comprehensively analyze the various driving factors of regional economic coordinated development, and carry out the work according to the characteristics of the factors. First of all, it is the factor of comparative advantage. During the period of economic development of each region, technology, capital and resources can become comparative advantages, which play a certain role in promoting the

coordinated development of economy. In different stages of coordinated development, there are various comparative advantages, for example, they may change from static to dynamic, or from resources Become knowledge. Secondly, the driving factors of economic ties are mainly manifested in the closeness of regional economic ties, the effect of energy loss on coordinated development, and so on. In different stages of economic coordinated development, regional economic ties will continue to evolve, not only the strength of ties will be comprehensively enhanced, but also the loss will begin to gradually reduce, which belongs to the current period of regional economic coordinated progress and development It is an important part of the communication. Finally, it is the driving factor of industrial division. In the process of collaboration, the industrial division will gradually optimize, with certain rules and sequence characteristics, and the division will continue to be clear. At the same time, with the increase of the number of subsystems, the regional industrial division will not gradually participate in the division. In addition, individual characteristics will also appear The characteristics of individual division of labor will continue to weaken in the state of subsystem.

4. Construction Measures of Driving Mechanism for Coordinated Development of Regional Economy

In order to better promote the coordinated development of the relevant regional economy, it is necessary to build a reasonable driving mechanism, promote the level of regional economic coordinated development under the driving of the relevant mechanism, and give full play to the value of the driving mechanism. The main construction measures are as follows

4.1 Identification Mechanism of Order Parameter

After a comprehensive analysis and systematic study of the driving factors of the coordinated development of regional economy, we can find that the driving factors mainly involve the comparative advantage factor, the industrial division factor and the economic connection factor. To a certain extent, these three factors may become the order parameters, and in each stage of regional economic development, the order parameters can also appear dynamic according to the change law of the three factors A sexual adaptation. In the initial stage of coordinated development, the subsystems in the economic system will not be closely related, and the industrial division of labor is not perfect. In the medium-term process of collaboration, each subsystem will strengthen the economic connection, no longer have strong individual characteristics, and the factors of economy and industrial division will have a significant driving effect. In the final stage of high-level collaborative development, each subsystem will have obvious comparative advantages, the economic ties between different regions will continue to strengthen, and the industrial division will become an order parameter. In this case, in order to ensure the perfection of the driving mechanism, we should focus on creating the identification mechanism of order parameters, accurately identify and use reasonable means to promote better

coordinated development of regional economy [2].

4.2 Create a Mechanism for Different Drivers to Cooperate with Each Other

From the actual situation, in the process of economic cooperation among different regions, the order parameters will change to a certain extent. No matter which driving factor finally becomes the order parameter, all factors will cooperate with each other, making the order parameters interconnected. As for the driving factors, they can be regarded as variable ties, which directly affect the collaborative evolution speed of the driving factors. For example, there is a relationship of mutual promotion between the two driving factors of regional comparative advantage and economic connection. Resources will directly affect the driving factors of comparative advantage, promote the exchange and sharing of tangible and intangible resources between regions, and create the connection between regional economies. In the case of scientific connection, comparative advantage will sharpen Elephant. At the same time, in the process of exchange, all kinds of factors between regions need to obtain the support of goods trade. Under the role of comparative advantage driving factors, both sides of trade can obtain more benefits and achieve the good purpose of win-win. Moreover, driven by economic benefits, the economic ties between regions will be more obvious, while strengthening economic ties In this case, the advantages of different regions will be brought into full play to make up for the lack of advantages among different regions. In the case of enhancing the driving factors of comparative advantage, it will play a good role in mutual promotion, mutual compensation and common progress among regions [3].

4.3 Establish Relevant Core Coordination Mechanism

In recent years, each region has begun to formulate the corresponding economic development system. However, in order to obtain short-term benefits, some regions ignore the long-term and sustainable development of their own economy, which will also have an impact on regional cooperation and increase the possibility of resource waste. Therefore, during the period of coordinated development of regional economy, we should create a regional economic cooperation system and build a core coordination mechanism according to the existing deficiencies and problems. In the case of fully implementing the core coordination system, first of all, we should improve the relevant performance evaluation system. For example, in the process of traditional performance evaluation, the per capita income will be reduced As the main indicator, the growth ratio should be integrated into the scientific outlook on development during the period of reform and innovation. According to the economic gap and industrial gap between regions, the relevant performance evaluation system should be compiled, so as to provide some help for the realization of economic synergy and stable development. Secondly, we should focus on the establishment of relevant development mechanism, clarify the role of each subject, and set the content of regulatory indicators under the condition of reasonably positioning the

regional role. During the period of formulating the regional strategic plan, we should also integrate the natural environment, ecological environmental protection and other factors into it, ensure the maintenance of the natural environment while the economic development, promote the sustainable progress of industry and economy, and build a security plan with long-term advantages, effective advantages and reasonable advantages. Finally, we should pay attention to the planning and management of the main area of action. On the basis of highlighting the synergy, we should ensure that China's macro plans and regional strategies can be maintained in a consistent state, unify and coordinate the interests of individual and the whole, so as to make the outline of regional economic development more harmonious, so as to avoid the phenomenon of random economic development of individual regions [4].

4.4 Building a Perfect Market Competition Driving Mechanism

From the perspective of the economic development of various regions in China, only by optimizing and innovating the market competition mechanism can we provide a certain guarantee for the allocation and improvement of various factors, make the economic distribution between regions good, arrange the factors reasonably, create the corresponding economic competitive advantage system of domain and scale, and enhance the regional competitiveness. For example, taking the economic relationship between regions as the main research content and optimizing the relevant market competition mechanism can break through the political boundaries between regions, and create a good economic coordination and economic development model between adjacent regions while maintaining healthy competition. Therefore, in the process of promoting the coordinated development of regional economy, we should actively create a market competition mechanism. First of all, in recent years, the reason for the increase of the economic gap between various regions in China is the existence of bad factors in terms of location. Therefore, during the period of establishing the market competition mechanism, we should reasonably carry out the construction of regional transportation and other infrastructure, formulate a sound industrial planning scheme, integrate advantageous resources, improve the internal structure, and prevent bad geographical factors to the greatest extent. The impact of the fastest speed to shorten the gap between each other. Secondly, because there is a big gap between different regions in terms of advantageous resources, in the process of building a collaborative driving mechanism, we should also improve the pricing mechanism according to the characteristics of resource products, unify the market value standards, ensure the utilization efficiency of resources, and build the pattern of regional development into a conservation oriented social system. Finally, we should create a supply mechanism on resource development, restrict the behavior of resource development and production, ensure good control of resource development behavior, promote good, healthy and stable progress of the environment, and enhance our own competitiveness [5].

4.5 Reasonable Construction of Supervision Driving Mechanism

During the period of coordinated development of regional economy, we should reasonably establish the supervision driving mechanism and system, and with the support of the supervision system, we can better promote the coordination of regional economy and narrow the gap between them. On the one hand, in terms of cross regional governance, we should formulate long-term and stable cooperation plans in combination with the characteristics of economic and interest relations of different regions, so as to obtain economic benefits in the process of mutual cooperation. During this period, we should actively create a supervision mechanism, supervise and manage the implementation of various work, the implementation of the system, the improvement of policies, etc., and assign professional supervisors to each region for management. On the other hand, we should create a mechanism and system of collaborative supervision, comprehensively consider the subjective initiative of each region, supervise and manage different fields in the process of regional economic cooperation according to the economic subject, level gap, interest relationship characteristics, etc., and strive to better promote the collaborative progress and development of regional economy in the new era of environmental background [6].

5. Conclusion

To sum up, in recent years, in the process of China's overall economic development, the coordinated development of regional economy has been widely valued. Only by reducing and shortening the economic differences between different regions can we really promote the overall progress of the national economy. Therefore, in the future development period, we should pay attention to the coordinated progress of regional economy, clarify various driving factors, build a perfect driving mechanism, and use the driving mechanism to effectively enhance the stability and scientificity of regional economic coordinated development, so as to achieve a good purpose of coordination.
