Abstract: Based on blockchain technology, this paper discusses the problems of metaverse media management and information security. First of all, it analyzes the challenges and dilemmas faced by metaverse media management, as well as the application prospect of blockchain technology in metaverse media management. Then, it focuses on the application scenarios, advantages and limitations of blockchain technology in the operation and management of metaverse media, and puts forward the corresponding information security strategy. Finally, the paper expounds the standardization construction of metaverse media management, including the application of blockchain technology in standardization construction and the challenges faced. This paper aims to provide a new solution for metaverse media management, promote the healthy development of metaverse, and also provide certain reference value for the application of blockchain technology in practice.

Keywords: blockchain technology, metaverse, media management

1. Introduction

With the continuous development of virtual reality technology and blockchain technology, metaverse is gradually rising as an emerging virtual social network platform. In the metaverse, users can interact, communicate, create and share content with others through virtual identities. This new digital social way also brings new challenges to traditional media management [1]. The research of metaverse media management and information security based on blockchain technology has important theoretical and practical significance. This paper explores how blockchain technology can be used to build a more secure, transparent, and trusted meta-media management system that enhances user experience and social value. This research can also promote the application of blockchain technology in practice and promote its development in the field of digital social communication.

2. Research status and progress

The application and development of metaverse technology, blockchain technology and other emerging technologies, not only include the research of identity authentication, data storage, smart contract and other technologies, but also include data encryption storage, smart contract management, consensus mechanism protection and other security fields [2,3]. The research on the standardization construction of metaverse media operation and management includes the research on platform access regulation, user privacy protection, financial transparency, content copyright protection, virtual currency supervision, security compliance management, etc.

Technology application: The application of emerging technologies such as metaverse technology and blockchain technology continues to expand, such as decentralized identity verification, data encryption storage, smart contract management, consensus mechanism protection and other technical applications have been preliminarily realized.

Security: In view of various information security risks existing in the metaverse, relevant researchers have proposed a series of security measures, such as data encryption storage, smart contract management, consensus mechanism protection, etc., to provide a guarantee for the safe development of the metaverse.

Standardization construction: The standardization construction of metaverse's media operation and management has gradually received attention, and relevant researchers have proposed a series of standardization construction schemes, such as platform access regulation, user privacy protection,
financial transparency, content copyright protection, virtual currency supervision, security compliance management, etc., which provides the foundation for the standardized operation of metaverse.

Application scenarios: The application scenarios of metaverse media management continue to expand, such as virtual reality, games, social networking, education, medical and other fields have initially appeared, providing opportunities for the commercial development of metaverse.

3. Challenges of metaverse media management

3.1 Overview of metaverse media operation and management

The metaverse is a virtual digital world, which is a new digital social way. In the metaverse, users can interact, communicate, create and share content with others through virtual identities [4]. This new digital social way also brings new challenges to traditional media management. The metaverse media management includes content production, platform operation, user management and so on. Among them, content production is the core of metaverse media management, including game development, virtual reality experience, virtual commodity design, etc. Platform operation refers to the construction, maintenance and promotion of the metaverse platform. User management refers to how to attract and retain users, improve user satisfaction and loyalty.

3.2 The application prospect of blockchain technology in the operation and management of metaverse media

① Digital asset trading: The metaverse involves a large number of virtual goods and virtual currencies, and blockchain technology can provide them with safer, faster and more convenient digital asset trading services.

② User authentication: Blockchain technology can provide users with a decentralized authentication mechanism to protect user privacy and personal information security.

③ Content copyright protection: Blockchain technology can provide copyright protection for content creators in the metaverse, ensuring that their intellectual property is fully protected.

④ Data storage and sharing: Blockchain technology can provide more secure, efficient and reliable solutions for data storage and sharing in the metaverse to ensure data integrity and security.

⑤ Decentralized autonomous organization: Blockchain technology can provide a decentralized management model for autonomous organizations in the metaverse, so that organization members can participate in organizational management and decision-making more just and transparently.

3.3 Challenges and dilemmas faced by the operation and management of metaverse media

① Information security issues: The metaverse involves a large number of sensitive data such as personal information and property, and how to ensure the security of these data has become an important issue.

② Virtual currency fraud and money laundering: Virtual currency transactions in the metaverse are often unregulated and easily used for illegal activities such as fraud and money laundering.

③ Standardization of platform construction: The construction, maintenance and promotion of the metaverse platform need to be standardized, but there is still a lack of corresponding norms and standards.

④ Content copyright protection: Content creators in the meta-universe need adequate copyright protection, but there is still a lack of effective technical means to achieve it.

⑤ User experience problem: The user experience of the metaverse needs to be continuously optimized, including the application of virtual reality technology and the way of social interaction.
4. The application of blockchain technology in the operation and management of metaverse media

4.1 Basic principles and characteristics of blockchain technology

① Decentralization: Blockchain technology adopts a decentralized management model, there is no centralized management organization, and all nodes have the same rights and status.

② Distributed ledger: Blockchain technology uses distributed ledger to store transaction records on multiple nodes to ensure data security and integrity.

③ Immutable: Blockchain technology uses technical means such as hash algorithm and encryption algorithm to ensure that transaction records cannot be tampered with to ensure the authenticity and credibility of data.

④ Open and transparent: Blockchain technology adopts an open and transparent way, and anyone can view and verify transaction records to ensure the transparency and fairness of data.

⑤ Smart contracts: Blockchain technology supports smart contracts, which can automatically execute contract terms and improve the efficiency and reliability of transactions.

⑥ High security: Blockchain technology adopts technical means such as cryptography and consensus mechanism to ensure the security of transaction records and prevent malicious attacks.

4.2 Application scenarios of blockchain technology in metaverse media management

① Digital asset trading: The meta-universe involves a large number of virtual goods and virtual currencies, and blockchain technology can provide them with safer, faster and more convenient digital asset trading services.

② User authentication: Blockchain technology can provide users with a decentralized authentication mechanism to protect user privacy and personal information security.

③ Content copyright protection: Blockchain technology can provide copyright protection for content creators in the metaverse, ensuring that their intellectual property is fully protected.

④ Data storage and sharing: Blockchain technology can provide more secure, efficient and reliable solutions for data storage and sharing in the metaverse to ensure data integrity and security.

⑤ Decentralized autonomous organization: Blockchain technology can provide a decentralized management model for autonomous organizations in the metaverse, so that organization members can participate in organizational management and decision-making more just and transparently.

⑥ Virtual currency regulation: Blockchain technology can provide regulatory means for virtual currency transactions in the metaverse to prevent illegal activities such as fraud and money laundering of virtual currencies.

4.3 Advantages and limitations of blockchain technology in the operation and management of metaverse media

4.3.1 Advantages

① Decentralization: Blockchain technology can provide a decentralized management model for the metaverse, making the platform more just and transparent.

② Secure and trustworthy: Blockchain technology adopts technical means such as cryptography and consensus mechanism to ensure the security of transaction records and prevent malicious attacks.

③ Immutable: Blockchain technology uses technical means such as hash algorithm and encryption algorithm to ensure that transaction records can't be tampered with to ensure the authenticity and credibility of data.

④ Data sharing: Blockchain technology can provide more secure, efficient and reliable solutions for data storage and sharing in the metaverse to ensure data integrity and security.
4.3.2 Limitations

① High technical threshold: Blockchain technology requires a professional technical team to develop and maintain, and the technical threshold is high.

② Slow transaction speed: The transaction speed of blockchain technology is relatively slow, which may affect the efficiency of transactions in the metaverse.

③ Difficult to upgrade: The upgrade and improvement of blockchain technology requires the support and recognition of the whole network nodes, and it is difficult to achieve rapid upgrade.

④ Regulatory issues: At present, there are still some problems in the supervision of blockchain technology, such as how to balance the contradiction between supervision and decentralization.

5. Information security guarantee strategy

5.1 The metaverse information security risk analysis

Identity theft: In the metaverse, users need to register an account and provide personal information, which can be stolen by hackers, resulting in identity theft and property loss. Virtual currency fraud and money laundering: Virtual currency transactions in the metaverse are often unregulated and easily used for illegal activities such as fraud and money laundering. Content infringement: Content creators in the metaverse need adequate copyright protection, but due to the nature of data replication and dissemination, there may be infringement problems. Malware attacks: Virtual environments in the metaverse can be attacked by malware, resulting in system crashes or data leaks. Data leakage: The metaverse involves a large number of personal information, property and other sensitive data, if these data are leaked, it will cause great losses to users.

5.2 Information security assurance strategy based on blockchain technology

Decentralized authentication: Using a decentralized authentication mechanism, users can master their own identity information and verify and authenticate through blockchain technology to protect user privacy and personal information security. Data encryption storage: Encryption algorithms are used to encrypt and store data to ensure data security and integrity and prevent data from being stolen or tampered with by hackers. Smart contract management: Use smart contract technology to automatically execute contract terms, improve the efficiency and reliability of transactions, and avoid risks caused by human factors. Blockchain supervision: Establish a blockchain supervision mechanism to supervise activities such as virtual currency transactions in the metaverse and prevent illegal activities such as fraud and money laundering. Guarantee of consensus mechanism: The consensus mechanism is adopted to ensure the consistency and correctness of transaction records of all nodes to prevent malicious attacks and tampering.

6. Standardized construction of metaverse media management

6.1 Standardized overview of metaverse media management

Through the formulation of platform access specifications, the platform is audited and certified to ensure the legitimacy and security of the platform. User privacy protection, clarify the collection, use and protection rules of user information, protect user privacy and personal information security. This approach allows financial transparency, disclosure of financial statements and transaction records, and prevention of misappropriation or misappropriation of funds. Content copyright protection protects the intellectual property rights of content creators and prevents infringement. Only by establishing a virtual currency regulatory mechanism and continuously regulating the issuance and trading of virtual currencies can we effectively prevent illegal activities such as fraud and money laundering. Security compliance management, formulate corresponding security standards and norms, strengthen the security monitoring and vulnerability repair of the system, and ensure the security and stability of the system. We make full use of information transparency, open platform operations and data, so as to ensure that information is open, transparent and fair.

6.2 Application of blockchain technology in the standardization of metaverse media management

Authentication: With a decentralized authentication mechanism, users can master their own identity information, and verify and authenticate through blockchain technology to protect user privacy and
personal information security. Data encryption storage: Encryption algorithms are used to encrypt and store data to ensure data security and integrity and prevent data from being stolen or tampered with by hackers. Smart contract management: Use smart contract technology to automatically execute contract terms, improve the efficiency and reliability of transactions, and avoid risks caused by human factors. Blockchain supervision: Establish a blockchain supervision mechanism to supervise activities such as virtual currency transactions in the metaverse and prevent illegal activities such as fraud and money laundering. Guarantee of consensus mechanism: The consensus mechanism is adopted to ensure the consistency and correctness of transaction records of all nodes to prevent malicious attacks and tampering. Security compliance management: Establish a security compliance management system, formulate corresponding security standards and norms, strengthen the security monitoring and vulnerability repair of the system, and ensure the security and stability of the system.

6.3 Challenges and prospects of standardization construction

6.3.1 Challenges

High technical threshold: The application of emerging technologies such as metaverse technology and blockchain technology requires a professional technical team for development and maintenance, and the technical threshold is high. It is difficult to supervise: the operation and management of metaverse media involves multiple fields and multiple interest relationships, which makes supervision difficult. How to balance the contradiction between supervision and decentralization is an important issue. Low user recognition: At present, the metaverse is still in the early stage, and user recognition is relatively low. How to improve user experience and trust is an important challenge. High security risks: As a virtual digital world, the metaverse has various information security risks, and how to ensure information security is an important challenge.

6.3.2 Outlook

Industrial integration: Metaverse media management involves multiple fields and multiple interest relationships, and there will be more industrial integration and collaborative development in the future. Technological innovation: With the continuous progress and innovation of technology, there will be more technological innovation and application scenarios in the operation and management of metaverse media. User experience upgrade: With the continuous improvement of users' recognition of the metaverse, there will be more high-quality user experience and services in the future. Improvement of regulatory mechanism: With the continuous improvement of regulatory mechanism, metaverse media operation and management will become more standardized and transparent, providing users with more secure and reliable services.

7. Conclusion

With the continuous development and application of metaverse technology and blockchain technology, the standardized construction of metaverse media operation and management has gradually attracted attention, and relevant researchers have proposed a series of standardized construction schemes, such as platform access regulation, user privacy protection, financial transparency, content copyright protection, virtual currency supervision, security compliance management, etc. At the same time, the industrial development of metaverse media management is also gradually taking shape, and relevant enterprises and institutions have begun to get involved in the field of metaverse and established a certain industrial chain and business model. In the future, metaverse media management will usher in a broader development prospect.
