ABSTRACT. *Nowadays, the overall living standard of residents in our country is constantly improving, the surrounding environmental conditions and the scope of life have set requirements and goals, the living environment must be comfortable and beautiful, and the degree of hygiene is also very impressive. The planning of garden landscape is not only beneficial to the progress of a city, but also improves the relationship between people and nature, and allows residents to value their environment. This article mainly considers and analyzes the privacy of urban public space garden landscape.*

KEYWORDS: *Privacy, Landscape planning, Urban public space*

1. Introduction

The current goal of how the garden landscape becomes urbanized is gradually clear, therefore the construction projects of most cities are constantly rising, which is also to achieve the common goal of everyone, that is to promote the progress of the city and realize the coexistence of nature and humanity. The protection of the natural environment and the improvement of the social economy requires a supporting point to maintain the balance. Therefore, for the planning and construction of urban public space gardens, the arrangement of green plants must be elegant, and all aspects of the private planning of the garden must be extremely important. Only in this way, urban residents will have a better living environment.

2. Overview of the Privacy of Urban Public Space Landscape Planning

There are many different perspectives of the privacy of garden landscape planning, but it mainly discuss about choosing different locations, and then designing the corresponding layout of the garden landscape within a reasonable range in order to achieve the requirements of controlling the urban public space and the provisions of the original performance [1]. The privacy of the garden landscape is a combination of subjective creativity and active choices. It makes the urban public space warm and intimate, and there is no longer a distance that cannot be crossed. Every resident in the city will enjoy the benefits of garden planning, having

a comfortable and free private space where is undoubtedly the environment that can enhance happiness for residents. 3. Deficiencies in the Private Design of Urban Public Space Garden Landscape Planning

In the past when China's economy was low, the design concept of the urban public space garden landscape did not draw enough people's attention. Almost all of the efforts are on the development of industries and corporate labors, which brought some adverse effects. For example, the public space of the city is not wide, the structure is too narrow, and the privacy is undoubtedly lacked [2]. It is precisely because some building developers want to get more profits in this period of rapid economic development, so they do not pay attention to the design of garden landscapes. There are too few details of public spaces in the city, and there are no levels of garden landscape structures. For urban residents, living in such an environment reduces the quality of life and the improvement of life happiness.

3. Some Measures to Strengthen the Privacy Design of Urban Public Space Garden Landscape Planning

3.1 Attention Should Be Paid to the Flexibility of Auxiliary Facilities in the Landscape Planning Process

The flexibility of auxiliary facilities will affect the comfort and well-being of people living in the city to a certain extent which is also an important part in the garden landscape planning. When designing and planning auxiliary facilities, designers should try their best to make different designs for auxiliary facilities according to the different functions of various areas in the overall urban planning. When designing auxiliary facilities, the flexibility of it should also be maximized, and the most functions can be achieved with the least cost. For example, when designing commercial areas, downtown areas, and other areas with large pedestrian flows, designers should consider that these areas have a lot of people, and most travelers and tourists will stay in these areas. When designing auxiliary facilities in these areas, you can appropriately widen the area of the greening table and the edges of various low walls, so that tourists or residents can get relaxed when they are tired of walking on the street. Auxiliary facility can also be designed more ergonomically, which makes it both beautiful and comfortable for people to sit on.

3.2 Attention Should Be Paid to the Ecology of Small Groups in the Process of Garden Landscape Planning

Generally speaking, the communication method that big group talk is not suitable for people in public areas. Most of the people in public areas are individuals who do not know each other. Such a chat method will make people feel constrained and uncomfortable. People in common public areas communicate with family and friends who are familiar with each other. This kind of communication can keep people in a comfortable and relaxed environment. The small group ecology in

landscape planning has this feature. The designer should always pay attention to the ecology of the small group, when planning the garden landscape, they should protect and strengthen the privacy of the small group ecology, so that the small group ecology can be independent of the external environment, avoiding people from being disturbed by outsiders when communicating in order to improve the comfortable feeling of small group ecology.

3.3 Pay Attention to the Privacy and Visibility of Private Spaces in the Landscape Planning Process

The privacy of the private space refers to the degree of privacy in the private space. The designer will put forward different requirements for the privacy of the private space in different positions in the garden landscape. However, the visibility of private spaces cannot be simply as the name implies, it refers to the visibility of roads and entrances to private spaces. The two components must be combined with each other in order to design a qualified private space. For example, when designing a private space, you can create a secret and quiet atmosphere by increasing the heights of the green plants and flower beds and using some evergreen broad-leaved trees, so that people in it can communicate freely. Additionally, through the combination of various low wall placements and the branching and extension of the road, the visibility of the private space can be changed, so that the private space will not be completely independent from the outside world.

4. Conclusion

With the development of the times, people in the society pay more and more attention to the privacy of the space. If the designers want to plan the garden landscape properly, they must pay attention to the points mentioned above. In the design, first plan the location of each space, make a reasonable transition, combine the private space and distinguish it from the large environment, and pay attention to the ecology of the small group and maximize the flexibility of the auxiliary society. Doing these can improve urban residents' comfort and well-being and design a qualified landscape plan.
