

Innovate ideas and continuously improve the construction of fire supervision and law enforcement

Fan Haojie

Shanghai Jiading District Fire Rescue Detachment, Jiading, Shanghai, 201800, China

Abstract: *With the acceleration of urbanization and social and economic development, people pay more and more attention to social fire safety, which puts forward higher requirements for fire prevention supervision. Only by innovating the original development ideas and strengthening fire supervision and law enforcement, can fire organizations create a good fire safety environment for society. This paper mainly explores how to innovate development ideas and improve the effectiveness of fire supervision and law enforcement.*

Keywords: *innovative development ideas, construction of fire supervision and law enforcement work.*

1. Introduction

In recent years, the scale of all kinds of high-rise buildings and underground buildings in China is getting larger and larger. These buildings have great fire hazards, which will threaten people's life safety. In order to minimize the probability of fire risk, the fire department must innovate the original development ideas, improve the overall quality and ability of the law enforcement team, and reform and innovate the fire supervision mechanism, so as to maximize the role of fire supervision.

2. Improvement of the fire supervision and management system

Although China has also revised the Fire Protection Law at the present stage and made clear the division of responsibilities of local governments, some local governments will still focus on attracting investment, lacking awareness of fire safety and failing to implement the fire responsibility system. When implementing the relevant laws, there is no supervision and management system. Although some departments have set up relevant systems, they have not strictly implemented them, so it is impossible to bring their own supervision role into full play. In view of the above situation, local governments and relevant departments should strengthen supervision and management measures, formulate and improve the assessment and supervision system, and formulate reward and punishment measures, so as to solve the problem of inadequate implementation of fire control supervision and management in various regions. It is necessary to give full play to the leading role of local governments, effectively implement the responsibilities of industry departments, and refine the specific responsibilities of fire supervision, so that each department can perform its own duties and do a good job in fire supervision. Each grass-roots unit should bring fire control work into the agenda. In addition, to establish and improve the supervision and management mechanism, we must first improve the joint law enforcement mechanism of the fire department, and carry out fire safety supervision in strict accordance with relevant rules and regulations, so as to control fire safety from the source.

3. Improvement of the comprehensive quality of law enforcement team.

Under the new situation, improving the comprehensive quality of the law enforcement team is an aspect that needs urgent attention and attention in the reform of the fire department. First, carry out the education of ideals and beliefs and the concept of socialist rule of law in a down-to-earth manner, guide fire law enforcement personnel to strengthen their ideals and beliefs, train fire supervisors' rule of law thinking in practical work, strive to improve their ability to solve problems and promote their work by using the rule of law thinking and the rule of law, and build a "ballast stone". The second is to carry out the system of holding certificates, and gradually obtain the legal professional qualification certificates organized by the national unity for the law enforcement personnel on duty at present; On the basis of obtaining the qualification of fire control post, the personnel who intend to enter the law enforcement

post must participate in the legal professional qualification certificate, pass the examination before taking up their posts, and further standardize and select law enforcement personnel from the source. Third, implement the strategy of strengthening the team with talents, vigorously advocate "professionals do professional work", actively train "experts" and "craftsmen" fire law enforcement personnel through large-scale training and large-scale competitions, regularly arrange young comrades to attend classes with old comrades, and train grass-roots comrades and government comrades in rotation, send existing law enforcement personnel to local universities for professional training, strengthen communication and contact with fire protection mechanisms in some developed countries, and strive to cultivate a growing cultural soil, build a scientific and practical growth platform and establish study.

4. Innovation of fire control publicity and education methods.

With the development of Internet and new media technology, people's ways to obtain and disseminate information have changed from traditional media to relying on the Internet, Weibo, WeChat, smart phones and other emerging networks and mobile media. In this era, to carry out fire protection propaganda work, it is necessary to firmly grasp the outstanding characteristics of new media communication methods, adopt modern output methods, mobilize various new media platforms to serve the main purpose of the work, and cooperate with traditional media propaganda, so as to create a strong fire protection propaganda atmosphere in all directions, and improve propaganda efficiency and publicity effect. For example, fire protection propaganda departments can use WeChat in WeChat official account and Weibo, etc. Publish some publicity and education posters, pictures and texts of fire laws and regulations, short videos of fire protection knowledge, daily law enforcement inspections or some practical cases to people at any time, so that people can master more common knowledge of fire safety, and at the same time, communicate and interact with the public online, answer questions for them, and highlight the diversity of publicity forms. Secondly, it is also possible to spread fire protection knowledge through LED screens and communicate with the public, so as to create a good publicity environment for fire protection science in society.

5. Promotion of the construction of fire Internet of Things.

As an advanced concept of urban safe operation and management, the Internet of Things is the practical application and concrete embodiment of the latest concept and technology of the Internet of Things in the field of fire protection. Through information sensing and communication technologies such as the Internet of Things, the fire protection information required by various elements involved in fire protection supervision and management and fire fighting and rescue is linked, and a high-awareness fire protection basic environment is constructed to realize real-time, dynamic, interactive and integrated fire protection information collection, transmission, processing and analysis, which can comprehensively promote and improve the level of socialized fire protection supervision and management implemented by the government and relevant institutions. By constructing the fire-fighting IOT sensing network, the fire-fighting safety elements are brought into the street-town integrated management platform. At the same time, the new generation of information technology is used to implement scientific and technological management for various small places and key units, and a dynamic supervision and law enforcement and fire-fighting data analysis and evaluation system is built to form a district-level fire-fighting digital base, which supports the digitalization, dynamics and refinement of fire-fighting management and gradually realizes the transformation from "traditional fire-fighting" to "modern fire-fighting".

6. Dependence on the professional strength of the third party.

Fire supervision and inspection is the main responsibility and obligation of the fire department. After the investigation of previous fires, it is found that the fire supervision and inspection is not in place, which will bring great hidden dangers to safety and is one of the causes of fires. At present, the requirements and standards for fire supervision and inspection work are getting higher and higher. Some units have a large area under their jurisdiction and involve a wide range of business forms. In addition, there are many transactional work and the level of fire law enforcement personnel is uneven, which makes it difficult to meet the needs of daily supervision and inspection. Actively communicate with relevant departments and units, establish a fire safety expert database, and provide fire safety

consultation and technical guidance; Commissioned by the safety inspection team to carry out fire safety inspection, publicity and education activities every month, increase the inspection and guidance force; Hire third-party technicians to carry out special tests on the indoor fire hydrant system in residential quarters and the opening of life channels; Mobilize grass-roots grid forces to do a good job of fire hazard investigation and publicity, and strive to form a good situation in which all forces work together to manage.

7. Conclusion

In a word, in order to carry out the fire control work smoothly and build a good fire control environment for the people, it is necessary to have strong fire control supervision work as the support. Therefore, the fire control department must reform and innovate the existing fire control supervision mechanism, improve the comprehensive quality of the law enforcement team by establishing and perfecting the fire control supervision and management system, establish and improve the system of selecting and employing people for fire control, and improve the level of fire control supervision with the help of high technology, so as to realize the sustainable development of fire control work.
